Alerts

This project is using react-toastify to handle alerts. If you want more in-depth info about them please refer to the documentation.

Usage

Here is an exemple of how you can create an alert.

```jsx
import React from "react";
import { toast } from "react-toastify";

export default function myComponent() {
   const iWasPressed = () => {
      // This will show an error alert.
      toast.error("Não foi possível acessar o backend");
   };

   return(
      <button onClick={iWasPressed}>
         Press me :D
      </button>
   );
}
```
